

Installation Guidance

Shelterguard™ and Treeguard™

Shelterguard™ and Treeguard™ for Cut to size

On exposed sites larger diameters may need two supports.

On sheltered sites two/three internal canes may be sufficient for the shorter sizes.

Fixing narrow diameter cut pieces (e.g. 9cm) is easier if the material is pre-rolled.

METHOD USING STAPLES:

1

Plant shrub using preferred method and clear surface vegetation within at least 10cm of planting position.

3a

This is generally considered the quickest method for fixing cut pieces. Fix one edge to the stake using just a couple of staples.

4a

Next wrap the material around the tree and staple to the stake down the overlap, using as many staples as seems necessary for the site conditions.

METHOD USING TIES:

2

Hammer a treated or naturally durable stake, a minimum of 25mm square, into ground about 5cm from tree.

If site is exposed, position into the prevailing wind.

3b

Place guard over shrub, if necessary, gathering branches together to ensure they are all pointing out the top of the guard.

4b

Use releasable ratchet ties through mesh holes and around stake to secure the guard.
